

Q3 2026 Performance Review

July – September 2026

Bandan Kumar

iOS Developer · DietPlan & Caloric

Q3 at a Glance

A new app from first screen to feature-complete, in one quarter

~7

**weeks of
development**

DietPlan app built end to
end

14

modules & features

Onboarding to AI meal
plans

~50 MB

smaller app size

~140 MB → 89.3 MB with
On-Demand Resources

100%

QA items resolved

Only 23 items logged for
the whole app

Result: DietPlan feature-complete by 8 Sept 2026, with only a 3-day extension.

Steady Delivery, Week on Week

Overall progress from weekly reports

Built the DietPlan App End to End

Every module developed and integrated by me

Onboarding

Validation, Firebase Auth, Firestore, Storage

Meal Plans & Recipes

Filters, meal swap, meal follow, carbs tracking

Weight & Body Tracking

Weight chart, body measurements

Reminders & Settings

Reminder presets, full settings flow

Apple Health

Reads health data into the app

Universal Links

Share meals & recipes, App Store fallback

Result: Feature-complete app built end to end, with only the premium screens left before release.

DietPlan in Action

Real screens from the app I built

Meal plans

AI-generated plan

Meal swap

Weight tracker

Reminders

Shopping list

Built the Meal & Recipe Data from Scratch

Taking ownership of the app's core content

Starting point

- Source CSV needed significant restructuring to fit the app
- Duplicate entries and inconsistent fields
- Scraping 54 lakh+ recipes from an external site was being considered

What I built

- Clean, non-redundant dataset built using the EatFirst API and AI generation
- Researched the API: direct calls instead of scraping
- Designed the new database and remapped the app's models

Result: Reliable, maintainable data, with no fragile scraper to keep alive.

Smaller, Faster App Download

Optimising what users download

~50 MB

reduction in app size

~140 MB → 89.3 MB

Apple On-Demand Resources

Moved heavy content out of the main app bundle, so it downloads only when needed.

Split database

Broke the large database into smaller databases, so users don't download everything at once.

Better first experience

A smaller install and faster first launch, especially on slower networks.

Result: Lighter app for every user, with content delivered on demand.

AI Features, Secured with App Attest

Adopting a newer Apple security technology

-  **AI meal plan generation**
Personalised meal plans generated with Gemini.
-  **Custom recipe adding**
Users can add their own recipes to plans.
-  **Project-level Cloud Function**
Moved AI calls from the shared function to a dedicated DietPlan function.
-  **Apple App Attest**
Only genuine app installs can call the AI backend. A newer security layer not yet widely used in our projects.

Firebase App Check

App Attest registered for DietPlan iOS

Result: AI features protected against misuse and unauthorised API calls.

AI Backend: Secure & Cost-Controlled

Every AI request passes through safeguards I built into the Cloud Function

Built-in tamper check: if the logged daily cost doesn't match the actual AI bill, it signals the backend has been compromised.

Result: AI usage is protected from misuse, limited in cost, and monitored daily.

Also Delivered: Caloric App Release

A second app: key issues fixed so it was ready for release

Premium & Offers

- Premium screen UI fixes
- Screen not dismissing
- Restore & auto-restore purchases
- Offer screen showing after logout / in review build

Backend

- Cloud Function was created but not wired in correctly
- Connected the app to it properly

Authentication

- Sign-out asked users to log in again, then deleted their data
- Fixed so sign-out works cleanly and safely

Result: Caloric issues fixed across subscriptions, backend and auth, and the app was released.

Quality & Ownership

Going beyond the assigned task list

Proactive self-QA

While QA cycles were pending, I tested the app myself and fixed anything that didn't feel right.

23 / 23 QA items closed

Only 23 QA items for the entire app. All resolved, and 6 were suggestions rather than bugs.

23 / 23 TL review points done

UI polish across Onboarding, Home and Meals: smooth number transitions, themed controls, infinite recipe carousel.

Analytics ready

Events added across the app so the product team can measure user behaviour from launch.

Growth & Team Contribution

Localization helper

Built an internal tool to automate app string translation. It supported several developers in their workflow at the time.

Planning & estimation

Created a module-wise estimated timeline before development and validated the data structure with a senior developer.

New technologies applied this quarter

Apple App Attest

On-Demand Resources

Gemini & ChatGPT

Cloud Functions

Universal Links

HealthKit

Area I'm working on

Communicating earlier and more proactively with design and product teams, so dependencies and open questions are raised sooner.

Key Challenges & How I Handled Them

Challenge	What I did	Outcome
Source data didn't fit the app's structure	Rebuilt the dataset using EatFirst API + AI generation	Clean, reliable database
Database redesign late in the build	Rebuilt the DB and remapped models and functions	Only a 3-day extension on the timeline
Design assets & content arrived late	Prioritised modules without dependencies first	Development never stalled
Securing AI calls	Dedicated Cloud Function with Apple App Attest	Backend protected from misuse
QA cycles running behind	Self-tested and fixed issues proactively	Only 23 bugs found, none major

Looking Ahead to Q4

Integrate the new premium screens once design is final

Launch DietPlan on the App Store

Adapt to the new Product Engineer role, managing both iOS and Android apps to reduce cross-team dependency

Keep improving proactive cross-team communication

Thank you
